

# Measurement of exclusive vector meson photoproduction in ultra-peripheral pPb and PbPb collisions with the CMS experiment

*Tuesday, 15 November 2022 12:45 (20)*

The exclusive photoproduction of vector mesons provides a unique opportunity to constrain the gluon distribution function within protons and nuclei. Measuring vector mesons of various masses over a wide range of rapidity and as a function of transverse momentum provides important information on the evolution of the gluon distribution within nuclei. A variety of measurements, including the exclusive  $J/\psi$ ,  $\rho$ , and  $\Upsilon$  meson production in pPb (at nucleon-nucleon center of mass energies of 5.02 and 8.16 TeV) and PbPb (5.02 TeV) collisions, will be presented as a function of squared transverse momentum and the photon-proton center of mass energy. Finally, compilations of these data and previous measurements are compared to various theoretical predictions.
